#### 1.Introduction

The NV3052CGRB, a 16,777,216-color System-on-Chip (SoC) RAMless driver LSI designed for small and medium size TFT LCD display, is capable of supporting up to 720xRGBx1280 pixels in resolution. The 2160-channel source driver can provide true 8-bit resolution and generate 256 Gamma-corrected values with an internal D/A converter.

The NV3052CGRB is able to operate with low IO interface power supply. Incorporating with several charge pumps, the NV3052CGRB can generate various voltage levels by an on-chip power management system for gate and source driver.

The built-in timing controller in the NV3052CGRB can support several functions to meet a wide variety of requirements about portable display applications. It provides SPI system interfaces which can be used to configure the system. It can also achieve high speed display data transmission by using the RGB video mode.

The NV3052CGRB also provides standby mode for power control considerations. For further power control requirements, the dynamic backlight control function, which is based on the image content, is also supported.

#### 2. Features

- One-chip solution for color amorphous TFT-LCD
- O Display Resolution
- 720 x RGB x (1280, others), (Source output from S1 to S1080, S1321 to S2400)
- 640 x RGB x (1280, others), (Source output from S1 to S960, S1441 to S2400)
- 600 x RGB x (1280,1024, others), (Source output from S1 to S900, S1501 to S2400)
- 540 x RGB x (1280,960, others), (Source output from S1 to S810, S1591 to S2400)
- **O** Display Data Memory: None (RAMless)
- System Interfaces
- SPI/RGB interface
- O Display Features
- Outputs 256γ-corrected values and using an internal true 8-bit resolution D/A converter to achieve 16,777,216 colors
- Built-in digital separate RGB gamma
- O Display Modes
- Power saving mode (standby)
- Low power consumption structure for source driver

#### **On Chip Function**

- Support DC-VCOM driving scheme
- RAMless driver with RGB video mode
- Built-in internal oscillator and hardware reset
- On-chip OTP program voltage generator
- Built–in OTP (3 Times) to store ID1~ID3
- Built–in OTP (2 Times) to store gamma curve
- Built–in OTP (1 Time) to store VGMP, VGMN, VCOM calibration
- Built-in 3 power structure modes for application
- Source output voltage level VGMP-AGND: 2.64  $\sim 5.85 V$  , VGMN-AGND: -2.51  $\sim$  5.70V

#### O Power Supply Range

- External power IC and PFM:
- I/O pads supply voltage (IOVCC): 1.65 ~ 3.6V
- Analog power supply voltage (VCI): 2.5 ~ 3.6V
  - Three-Power Mode:
- I/O pads supply voltage (IOVCC): 1.65 ~ 3.6V

- Analog power supply (VSP): 4.5V to 6V
- Analog power supply (VSN): -4.5V to -6V

## 3. Block Diagram

#### 3.1 Block Function:

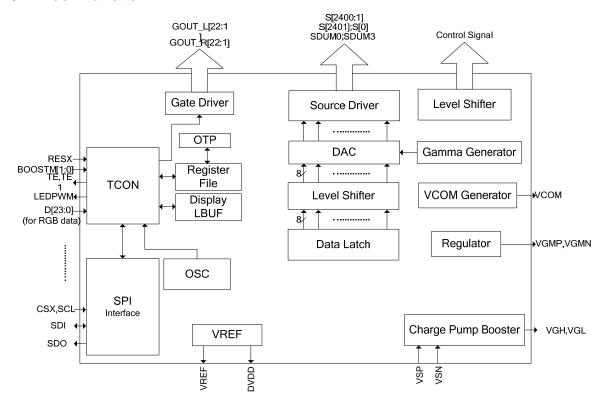

Figure 3.1

#### 3.1.1 System interface

The NV3052CGRB supports the video data transmitted through the SPI/RGB system interface.

#### 3.1.2 Grayscale voltage generating circuit

NV3052CGRB has true 8-bit resolution D/A converter, which generates 256 Gamma-corrected values and cooperates with OP-AMP structure to enhance display quality. The grayscale voltage can be adjusted by grayscale data set in the  $\gamma$ -correction register and RGB can be adjusted separately.

#### 3.1.3 Timing controller

NV3052CGRB has a timing controller, which can generate a timing signal for internal circuit operation such as gate output timing, image data accessing timing, etc.

#### 3.1.4 Oscillator (OSC)

The NV3052CGRB also features an internal oscillator. In standby mode, the oscillator is halted to reduce power consumption.

#### 3.1.5 Source driver circuit

NV3052CGRB consists of a 2160-output source driver circuit (S1 to S1080, S1321 to S2400) and several source dummy outputs (SDUM3;SDUM0;S[2401];S[0]). Data transmitted through RGB video mode are latched when a single line data has been accumulated. And then the latched data controls the source driver and generates a drive waveform.

#### 3.1.6 Gate driver circuit

NV3052CGRB consists of output gate driver control circuit. The gate driver circuit outputs gate driver signals at either VGH or VGL level.

#### 3.1.7 LCD driving power supply circuit

The LCD driving power supply circuit generates the voltage levels VGH, VGL and VCOM for driving an LCD. All this voltages can be adjusted by register setting.

#### 5.INSTRUCTIONS

#### 5.1. Outline

The NV3052CGRB supports SPI system interface to configure the system via accessing command registers. While accessing the command registers, the information that indicates which register would be accessed should be sent first. After that, the new value can be updated via system interface. Updating command instructions can also be accomplished by using SPI system interface.

The NV3052CGRB has the following major categories of

#### instructions:

- (1). System function instructions (User Command Set).
- (2). Customer Command List and Description (Manufacturer Command Set / Command 2).

Since updating these instructions are asynchronous to the internal clock of the NV3052CGRB, the updating procedure will require no waiting cycles. Furthermore, the updating procedure will not interfere with the processing of the host controller, this makes instructions can be handled smoothly and efficiently.

The following contents of this chapter will describe the supported instructions in detail.

System function commands

After the H/W reset by RESX pin or S/W reset by SWRESET command, each internal register will return to the default state (Please refer to "RESET TABLE" section). The commands 10h, 11h, 20h, 21h, 22h, 23h, 28h, 29h, 36h will be updated only during V-sync periods while module is in the "Sleep Out" mode to avoid abnormal visual effects, and will be updated immediately in the "Sleep In" mode. The Read Display Power Mode (0Ah), Read Display MADCTR (0Bh), Read Display Pixel Format (0Ch), Read Display Image Mode (0Dh),Read Display Signal Mode (0Eh), and Read Display Self Diagnostic Result (0Fh) will be updated immediately in both "Sleep In" and "Sleep Out" mode.

System function command accessing flow is described as the following example.

Example 1: Sleep Out CMDWR 0x11

Example 2: Display On CMDWR 0x29

Example 3: TE ON CMDWR 0x35 DATWR 0x00

#### 6. FUNCTIONS

#### 6.1.1 RGB Interface Selection

The RGB interface is operated with VS, HS, DE, PCLK, D[23:0] lines. It supports several pixel formats that can be selected by dpi [2:0] bits in "Interface Pixel Format (R3Ah)" of Page 0 command. The selection of a given interface is defined by dpi [2:0] as show in the below table

**RGB** Interface Selection

	dpi[2	2:0]	RGB Interface Mode	Used Pins

RGB Interface 16/18/24-bit pixel format selection

The Pixel clock (PCLK) is running all the time without stopping, it is used for entering VS, HS, DE and D[23:0] states when there is a rising edge of the PCLK. The PCLK can not be used as the internal clock for other functions of the display module.

Vertical sync hronization (VS) is used to tell when there is received a new frame of the display. This is low enable and its state is read to the display module by a rising edge of the PCLK signal.

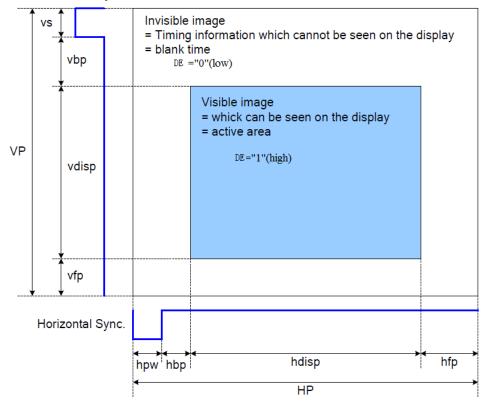

Horizontal synchroni zation (HS) is used to tell when there is received a new line of the frame. This is low enable and its state is read to the display module by a rising edge of the PCLK signal.

DE (Data Enable) is used to tell when there is received RGB information that should be transferred on the display. This is a high enable and its state is read to the display module by a rising edge of the PCLK signal.

D[23:0] are used to tell what is the information of the image that is transferred on the display(When DE= '0' (low) and there is a rising edge of PCLK). D[23:0] can be '0' (low) or '1'(high). These lines are read by a rising edge of the PCLK signal.

#### 6.1.2 RGB Interface Mode Selection

NV3052CGRB supports two kinds of RGB interface, DE mode and SYNC mode. The table shown below uses command 23h to select RGB interface mode.

### 6.1.3 RGB Interface Timing

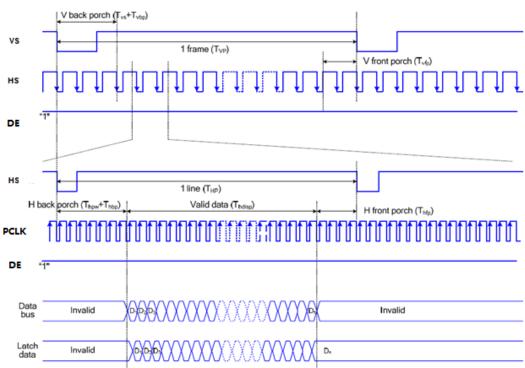

The timing chart of RGB interface DE mode is shown as follows.

Timing Chart of Signals in RGB Interface DE Mode

Note: The setting of front porch and back porch in host must match that in IC as this mode.

The timing chart of RGB interface SYNC mode is shown as follows.

Note: 1. If using Image Process Algorithm, Type value for H-blanking is minimum requirement.

### 6.2. Serial Interface (SPI)

The serial interface is used to communication between the micro controller and the LCD driver chip. It contains CSX (chip select), SCL (serial clock), SDI (serial data input) and SDO (serial data output). Serial clock (SCL) is used for interface with MPU only, so it can be stopped when no communication is necessary. If the host places the SDI line into high-impedance state during the read intervals, then the SDI and SDO can be tied together.

#### 6.2.1. SPI write mode

The write mode of the interface means the micro controller writes commands and data to the NV3052CGRB. The serial interface is initialized when CSX is high. In this state, SCL clock pulse or SDI data have no effect. A falling edge on CSX enables the serial interface and indicates the start of data transmission. When CSX is high, SCL clock is ignored. During the high time of CSX the serial interface is initialized. At the falling CSX edge, SCL can be high or low. SDI / SDO is sampled at the rising edge of SCL. R/W indicates, whether the byte is read command(R/W = '1') or write command (R/W = '0'). It is sampled when first rising SCL edge. If CSX stays low after the last bit of command/data byte, the serial interface expects the R/W bit of the next byte at the next rising edge of SCL.

#### **Register Write: Singal Parameter**

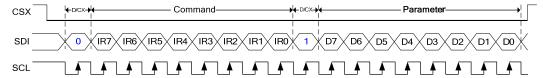

Figure: SPI Protocol for write

#### 6.2.2. SPI read mode

The read mode of the interface means that the micro controller reads register value from the NV3052CGRB. To do so the micro controller first has to send a command and then the following byte is transmitted in the opposite direction. After that CSX is required to go high before a new command is send. The NV3052CGRB samples the SDI (input data) at the rising edges, but shifts SDO (output data) at the falling SCL edges.

Thus the micro controller is supported to read data at the rising SCL edges. After the read status command has been sent, the SDI line must be set to tri-state no later than at the falling SCL edge of the last bit. For the memory data read, a dummy clock cycle is needed (8 SCL clocks) to wait the memory data send out in SPI interface. But it doesn't need any dummy clock when execute the command data read.

#### Register Read: Without dummy clock

### 6.3. Sleep Out-Command And Self-Diagnostic Functions Of The Display Module

#### 6.3.1. Register loading detection

Sleep Out-command is a trigger for an internal function of the display module, which indicates, if the display module loading function of factory default values from OTP (one-time programming memory) to registers of the display controller is working properly.

There are compared factory values of the OTP and register values of the display controller by the display controller. If those both values (OTP and register values) are same, there is inverted (=increased by 1) a bit in "Read Display Self-Diagnostic Result (0Fh)" (=RDDSDR) (The used bit of this command is D7). If those both values are not same, this bit (D7) is not inverted (= increased by 1).

The flow chart for this internal function is following:

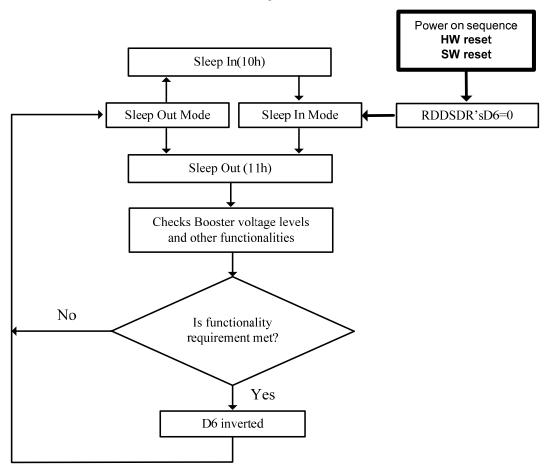

### 6.3.2. Functionality detection

Sleep Out-command is a trigger for an internal function of the display module, which indicates, if the display module is still running and meets functionality requirements.

The internal function (= the display controller) is comparing, if the display module is still meeting functionality requirements (only Booster voltage level). If functionality requirement is met, there is inverted (= increased by 1) a bit in "Read Display Self- Diagnostic Result (0Fh)" (=RDDSDR) (The used bit of this command is D6). If functionality requirement is not same, this bit (D6) is not inverted (= increased by 1).

The flow chart for this internal function is following:

Note: There is needed 120msec after Sleep Out -command, when there is changing from Sleep In -mode to Sleep Out -mode, before there is possible to check if functionality requirements are met and a value of RDDSDR's D6 is valid. Otherwise, there is 5msec delay for D6's value, when Sleep Out -command is sent in Sleep Out -mode.

### 6.4. Power On/Off Sequence

IOVCC and VCI can be applied in any order. IOVCC and VCI can be powered down in any order.

During power off, if LCD is in the Sleep Out mode, VCI and IOVCC must be powered down minimum 120msec after RESX has been released.

During power off, if LCD is in the Sleep In mode, IOVCC or VCI can be powered down minimum 0msec after RESX has been released.

CSX can be applied at any timing or can be permanently grounded. RESX has priority over CSX.

Note 1: There will be no damage to the display module if the power sequences are not met.

Note 2: There will be no abnormal visible effects on the display panel during the Power On/Off Sequences.

Note 3: There will be no abnormal visible effects on the display between end of Power On Sequence and before receiving Sleep Out command.

Also between receiving Sleep In command and Power Off Sequence.

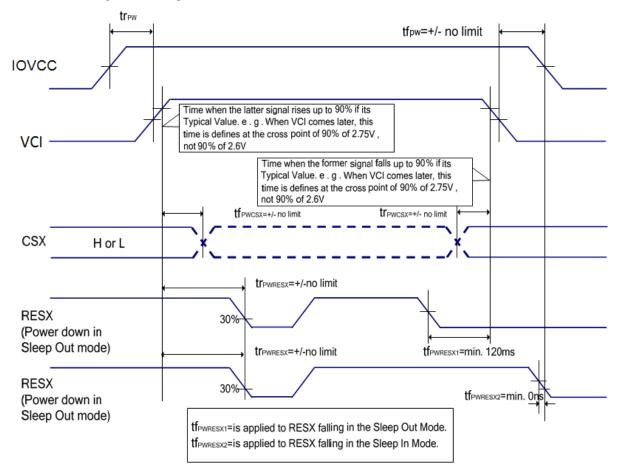

If RESX line is not held stable by host during Power On Sequence, then it will be necessary to apply a Hardware Reset (RESX) after Host Power On Sequence is complete to ensure correct operation. Otherwise function is not guaranteed.

The power on/off sequence is illustrated below:

### 6.4.1. Case 1 – RESX line is held high or unstable by host at power on

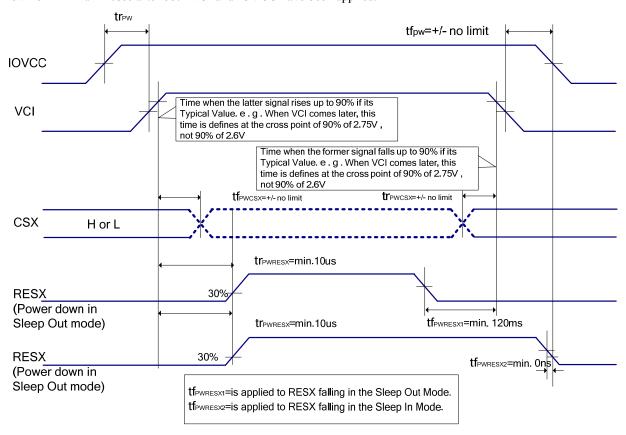

If RESX line is held High or unstable by the host during Power On, then a Hardware Reset must be applied after both VCI and IOVCC have been applied – otherwise correct functionality is not guaranteed. There is no timing restriction upon this hardware reset.

### 6.4.2. Case 2 - RESX line is held low or unstable by host at power on

If RESX line is held Low (and stable) by the host during Power On, then the RESX must be held low for minimum 10sec after both VCI and IOVCC have been applied.

#### 6.4.3. Uncontrolled power off

The uncontrolled power off means a situation when e.g. there is removed a battery without the controlled power off sequence. There will not be any damages for the display module or the display module will not cause any damages for the host or lines of the interface.

At an uncontrolled power off the display will go blank and there will not be any visible effects within (TBD) second on the display (blank display) and remains blank until "Power On Sequence" powers it up.

Note 1: Due to an electrostatic discharge on RESX line, spike does not cause irregular system reset according to the table below.

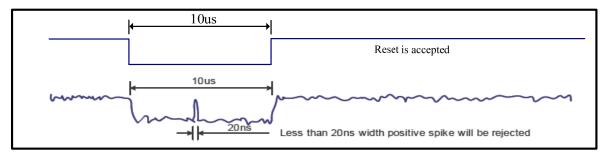

RESX Pulse	Action					
Shorter than 5us	Reset Rejected					
Longer than 10us	Reset					
Between 5us and 10us	Reset starts (It depends on voltage and temperature condition.)					

Note 2: During the resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120ms, when Reset Starts in Sleep Out mode. The display remains the blank state in Sleep In mode), then return to default condition for H/W reset.

Note 3: During Reset Complete Time, ID1/ID2/ID3 and VCOM value in OTP will be latched to internal register. After a rising edge of RESX, there is a H/W reset complete time (Trest) which lasted 5ms..The loading operation will be done every time during this reset.

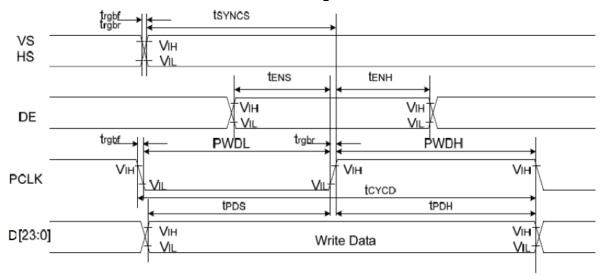

Note 4: Spike Rejection also applies during a valid reset pulse as shown below:

Note 5. It is necessary to wait 5msec after releasing RESX before sending commands. Also Sleep Out command cannot be sent for 120 msec.

#### 9. DISCLAIMER

The information appearing in this publication is believed to be accurate.

Integrated circuits sold by NV Technology are covered by the warranty and patent indemnification provisions stipulated in the terms of sale only. NV Technology makes no warranty, express, statutory implied or by description regarding the information in this publication or regarding the freedom of the described chip(s) from patent infringement. FURTHERMORE, NV Technology MAKES NO WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PURPOSE. NV Technology reserves the right to halt production or alter the specifications and prices at any time without notice. Accordingly, the reader is cautioned to verify that the data sheets and other information in this publication are current before placing orders. Products described herein are intended for use in normal commercial applications. Applications involving unusual environmental or reliability requirements, e.g. military equipment or medical life support equipment, are specifically not recommended without additional processing by NV Technology for such applications. Please note that application circuits illustrated in this document are for reference purposes only.
